

ABSTRACT OF THE DISCLOSURE

Method and apparatus for displaying information of data to be deleted in a digital video recorder are configured to read management information (e.g., recording date and time) of data to be deleted from a hard disk (HDD) when it is required to overwrite data on the HDD. Data overwriting can occur because of insufficient spare space of the HDD, during the recording operation of a digital video recorder. The read management information can be displayed along with the recording status of the HDD. Accordingly, a user can recognize, in advance, the data to be deleted in accordance with the data overwriting operation, and thus, selectively back up the data to be deleted.
